App Overview:

This app will be used by Sabancı University students to find empty rooms within the campus. Sometimes students need a room to study or for other things and with this app they will be able to find a room that has no lecture or event going on for the time period they are interested in.

Core Features:

- The home page is going to show features like “Find the Nearest Empty Room", “Room Schedules”, “Campus Activities” , “Reserve a Room”, “My Reservations” , “Campus Map” which are all going to lead to new pages.

- “Find the Nearest Empty Room" page will show the nearest rooms that have no activity going on. The app will also use GPS to locate the student and direct them to the nearest empty room.

- “Room Schedules” page will show each room’s daily schedule. There will be a filter to show official reservations like lectures, events club activities and reservations that students made using the app. It will have a filter for faculties, laboratories, events and can filter out keycard only entries. It will also have a date selector.

- “Campus Activities” page will show the events going on in the campus on that day and in which room they will be held.

- “Reserve a Room” page will let students reserve a room or lab, and GPS is used to confirm that the student is actually there during the reserved time. The reservation information can be seen by the other students using the app.

- “My Reservations” page will show the upcoming and past reservations. It will also have an option to cancel the reservation.

- “Campus Map” page will have an interactive map that shows the student’s location as well as the location of the reserved room and it will lead the student to that room.

- “Room Information” page will open by tapping a room anywhere and it will give details about that room.

Optional Features:

- Adding the virtual tour links available at mySU

- Names of the people in a student club executive board, as their names are given to the system if the room is reserved for a student club meeting or a student club event.

- The ability for the board member that reserved the room for a club event to add more metadata for the users to learn more about the event. Such as event description, clubs that hold it, poster image, etc.

- Capacity of each room

Data Requirements:

- The data present with the following link will be used: Room Schedules and Searching

- Each room's activity times and their codes will be important to store in the database

- The list of all student clubs and all student club board members for the optional features

- MySQL will be used for the database

- Node.js will be used for hosting the services for claiming rooms, the web-scraping of official reservations and optional features.

Potential Challenges:

- Data storage methods

- Filtering the data

- Showing a big data pile for phone screens
